

Do the issued forecasts predict signed cross moments more accurately?

Dynamic vs constant correlation

Wave Holm p: 0.775; cumulative: 1

2016-2019

MSE difference: $-4.58e-11$

2020-Oct 2025

MSE difference: $-2.25e-10$

−2 −1 0 1
Candidate – control MSE (decimal log return⁴) $\times 10^{-9}$

Dynamic vs constant matrix

Wave Holm p: 0.138; cumulative: 1

MSE difference: $-2.92e-09$

MSE difference: $-1.82e-08$

−3.0 −1.5 0.0
Candidate – control MSE (decimal log return⁴) $\times 10^{-8}$

Lines: nominal 95% block-bootstrap/HAC interval envelopes. Negative is better; dotted reference: $-1e-10$.

Both controls require the fixed effect, stability and multiplicity gates. Same frozen forecasts; no refitting or percentage gains.
