

Can forecast-error memory improve SPX risk alerts?

Lines: nominal 95% block-bootstrap/HAC interval envelopes. Negative is better; dotted reference: -0.0005 .
Scales differ. Both controls require effect/stability gates, wave Holm2 $p < 0.000131578947$ and cumulative Holm131 $p < 0.05$.
Archival daily OHLC risk proxy; event above twice the prior22-session mean; no trading-profit claim.
