

Replay: does a civil quarter-end increment improve SPX risk forecasts?

Lines: nominal 95% block-bootstrap/HAC interval envelopes. Negative is better; dotted reference: -0.005 .

Scales differ. Both controls require effect/stability gates, wave Holm2 $p < 0.000163398693$ and cumulative Holm127 $p < 0.05$.

Archival daily OHLC risk proxy; no exchange-expiry, rebalance or trading-profit claim.
