

Does closing location help predict unusually high SPX risk?

Lines: nominal 95% block-bootstrap/HAC interval envelopes. Negative is better; dotted reference: -0.0005 .
Scales differ. Both controls require effect/stability gates, wave Holm2 $p < 0.00014619883$ and cumulative Holm129 $p < 0.05$.
Archival daily OHLC risk proxy; event above twice the prior22-session mean; no trading-profit claim.
